

LAMINATE SHEETING FOR POUCHES

ABSTRACT OF THE DISCLOSURE

5 A pouch or other container for forming an envelope protectively
packaging a product such as a flowable or solid food substance. The pouch is
fabricated from a laminate sheeting whose plies have different properties that depend on
package requirements, at least one ply in the laminate being an oriented, synthetic
plastic film of high tensile strength. The plies are adhesively interlaminated at ambient
temperature with a water-based adhesive whereby the orientation of the film is
10 unaffected by the laminating process, in the course of which no environmentally
objectionable fumes are discharged into the atmosphere. The laminate may also be
made into a water-resistant envelope or package for mailing various materials.
